Tightly associated subunits (TAF's) are components of the transcription factor TFIID and are thought to mediate transcriptional activation. This encoded protein may be produced recombinantly from transformed host cells or purified from human cells. hTAFIIIO5 specific binding agents such as specific antibodies could be used for diagnosis (e.g. genetic hybridisation screens for hTAFIIIO5 transcripts), therapy (e.g. gene therapy to modulate hTAFIIIO5 gene expression) and in the biopharmaceutical industry (e.g. as immunogens, reagents for isolating B

New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess biodiversity
                                                                                                                                                                                      2001-639362/73
                                                                                                                                                                                 AAS73655

Claim 20; SEQ ID No 39827; 103pp; English

CC polypeptide (II) sequences. (I) is useful as hybridisation probes, CC polymerase chain reaction (PCR) primers, oligomers, and for chromosome CC and gene mapping, and in recombinant production of (II). The CC polynuclectides are also used in diagnostics as expressed sequence tags of restore normal activity of (II) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving CC (II). (II) is useful for generating antibodies against it, detecting or creation of supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating CC disorders involving aberrant protein expression or biological activity. The polypeptide and polynuclectide sequences have applications in CC diagnostics, forensics, gene mapping, identification of mutations or responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and CC amino acid sequences. ABG00010-ABG30377 represent novel human CC diagnostic amino acid sequences of the invention.

CC Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at the companies. The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes Sequence ftp.wipo.int/pub/published_pct_sequences. 801 AA;

                                                                                                                                                                   wt. of 130 kD by SDS-PAGE.

The invention relates to purified proteins involved in transcription by RNA polymerase II, the RNA polymerase which transcribes messenger RNA. RNA polymerase II transcription proceeds in vitro upon addition of several nuclear fractions designated TFIIA, B, D, E, F, H, I and J to RNA polymerase II holoenzyme. Fraction of TFIID has been shown to contains a TBP and other TAPs. Purification of TFIID and separation of its components reveals 7 proteins ranging in size from 30-250 kD.

Serum raised against the TFIID fraction allowed cloning of the corresp.
                                                                                                                                                                                                                                                                                        This is the amino acid sequence of the human TATA-binding protein (TBP) associated factor (TAF) designated TAFIII30. The protein is a component of the TFIID fraction required for reconstituting RNA polymerase II in vitro transcription activity. The encoded protein has an estimated mol.
                                                                                                                                     Sequence
                                                                                                                                                                                                                                                                                                                                                                Examples;

                            polypeptide, hTAFII100 (mol. weight 100kD). TAF peptides derived from hTAFII30 alpha, hTAFII30 beta, hTAFII40, hTAFII70, hTAFII70, hTAFII100, hTAFII100, hTAFIII250, hTAFII350 beta, hTAFII110 and nucleic acids encoding them, are used to modulate transcription, including transcription initiation. TAFS are nuclear proteins involved in RNA polymerase I, II and III transcription. The peptides act by binding to a different TAF, an activator, or TBP (TATA-binding protein) or competitively inhibiting association of a TAF domain with another compound, typical
                                                                                                                                                                          Nucleic acids encoding human TATA-binding (TAF) peptide(s) - for production of record for modulating transcription of TAFs
                                                                                                                                                                                                                                                                                                                                                                                                                                                                             RNA polymerase transcription; TATA-binding protein; TBP; initiation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    08-OCT-1997

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    339
                                                                                                                                                                                                                                                                                          T
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     14;
```

```
CC compound for interaction with essential proteins (EP) or for modulation CC of EP activity e.g fungal gene transcription. The proteins tested in the CC invention include RPC34, POB3, TFA2, NAB2, MPT1, MTR2, BOS1, POL30, RSA2, CC ECO1, ORC2, CNS1, YPD1, TIM10 and SRB4 from S. cerevisiae, C. albicans CC and human homologues. The method involves contacting a culture with one CC or more test compounds and determining the effects on the growth or CC viability of the culture of cells which preferably comprises fungal cells or yeast cells. Preferably the identified compounds interact with, or CC modulate (preferably inhibit) activity of C. albicans EP. The inhibitor CC compounds identified by the method are useful for preventing or in a manual. The antifungal agents interact with sesential fungal elements CC that can be used to treat fungal infection by preventing the growth and CC preferentially killing the fungal infection by preventing the biological activity of mammalian homologues. This amino acid sequence represents a CC method of the invention.

They are used in the development of specific blochemical assays for screening compounds that agonise or antagonise selected transcription factors involved in regulating gene expression associated with human pathology.

The protein is a component of the TFIID fraction required for reconstituting RNA component of the TFIID fraction required for reconstituting RNA component of the TFIID fraction activity. The encoded protein that an estimated mol. wt. of 110 kD by SDS-PAGE, a calculated mol. wt. of 10 kD by SDS-PAGE, a calculated mol. wt. of the invention relates to purified proteins involved in transcription by RNA polymerase II, the RNA polymerase which transcribes messenger C RNA. RNA polymerase II transcription proceeds in vitro upon addition of several nuclear fractions designated TFIIA, B, D, F, H, I and J C to RNA polymerase II holoenzyme. Fraction TFIID has been shown to C contains a TBP and other TAFS. Purification of TFIID and separation of the corresp. CC Serum raised against the TFIID fraction allowed cloning of the corresp. Teve

                                                                                                                                                                                                                                        AAW25028 represents TATA-binding protein associated factor (TAF) polypeptide, dTAFII10 (mol. weight 110kD). TAF peptides derived from dTAFII30 alpha, dTAFII30 beta, dTAFII40, dTAFII60, dTAFII80, dTAFII10, dTAFII50, and dTAFII250, their human equivalents and nucleic acids encoding them, are used to modulate transcription, including transcription initiation. TAFS are nuclear proteins involved in RNA polymerase I, I and III transcription. The peptides act by binding to a different TAF, an activator, or TBP (TATA-binding protein) or competitively inhibiting association of a TAF domain with another compound, typically a protein like TBP or another TAF, an activator,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Š
                               capable of detecting 1000 or more genes from Drosophila. The invent useful in developmental biology and in elucidating cell signalling cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins (ABB57737-ABB72072).

The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from
                                                                                                                                   The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invent

      The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The inventions for in developmental biology and in elucidating cell signalling cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABI16176-ABI30511), expressed DNA
sequences

The inventiuseful in developmental biology and in elucidating cell signalling cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL101840-ABL10151), expressed DNA sequences (ABL101840-ABL10151) and the encoded proteins

Epitopes of the encoded protein can be used in defining functional domains of HCF, identifying compounds that associate with HCF or designing compounds capable of modifying HCF transcription. Such agents can be used to treat viral infections.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to polynucleotides (AAK51456-AAK53435) and the encoded polypeptides (AAM78323-AAM80302) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polynucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, haematopoicsis regulating activity, tissue growth factor activity, immunomodulatory activity and activin/inhibin activity and may be useful in the diagnosis and/or treatment of cancer, leukaemia, nervous system disorders, arthritis and

 This cDNA sequence encodes a human tata-binding protein associated factor, hTAFII105, isolated from Daudi cell nuclear extracts. Tightly associated subunits (TAF's) are components of the transcription factor FFIID and are thought to mediate transcriptional activation. This encoded protein may be produced recombinantly from transformed host cells or purified from human cells. hTAFII105 specific binding agents such as specific antibodies could be used for diagnosis (e.g. genetic hybridisation screens for HTAFII105 transcripts), therapy (e.g. genet therapy to modulate HTAFII105 gene expression) and in the blopharmaceutical industry (e.g. as immunogens, reagents for isolating B cell specific activators or other transcriptional regulators).

```
This DNA encodes a polypeptide comprising a (modified) fragment (I) of a TATA box-binding protein associated factor II 105 (TAFII105). A pharmaceutical composition comprising (I) or the polynucleotide or an inhibitor or antagonist of (I) is useful for treating cancers and inducing apoptosis in pathological cells. The composition is also useful for treating autoimmune diseases, inflammatory processes and viral or
 Polypeptide encoding TATA box binding protein associated factor II 105 useful for treating e.g. cancers and inducing apoptosis has a dominant negative effect on the normal biological activity of the binding

 The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chair reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polymerase chair reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polymeric country of (II) is useful in gene therapy techniques to restore normal activity of (II) or treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as (II). (II) and its binding partners are useful in medical imaging of stres expressing (II). (I) and (II) are useful in medical imaging of stres expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polyprotectide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. Ask64197-AsS94564 represent novel human diagnostic coding sequences of the invention.

Note: The sequence data for this patent did not appear in the printed security from WIPO

This is the nucleotide sequence encoding the human TATA-binding protein (TBP) associated factor (TAF) designated TAFIII30. The protein is a component of the TFIID fraction required for reconstituting RNA polymerase II in vitro transcription activity. The encoded protein has an estimated mol. Wt. of 130 kD by SDS-PAGE.

The invention relates to purified proteins involved in transcription by RNA polymerase which transcribes messenger RNA. RNA polymerase which transcribes messenger RNA. RNA polymerase TFIIA, b. D. E. F. H. I and J to RNA polymerase II thosenzyme. Fraction TFIID has been shown to contains a TBP and other TAFs. Purification of TFIID and separation of

 New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell interactions -
 The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01876) and the encoded proteins

polymerase II in vitro transcription activity. The encoded protein has an estimated mol. wt. of 110 kD by SDS-PAGE, a calculated mol. wt. based on sequence of the gene of 99.4 kD and an estimated pio f 10.1. The invention relates to purified proteins involved in transcription by RNA polymerase II, the RNA polymerase which transcribes messenger RNA. RNA polymerase II transcription proceeds in vitro upon addition of several nuclear fractions designated FIIA, B, D, E, F, H, I and J to RNA polymerase II holoenzyme. Fraction TFIID has been shown to contains a TBP and other TAFs. Purification of TFIID and separation of its components reveals 7 proteins ranging in size from 30-250 kD. Serum raised against the TFIID fraction allowed cloning of the correspecies from lambda-gtil expression libraries.
 2072
 This is the nucleotide sequence encoding the Drosophila TATA-binding protein (TBP) associated factor (TAF) designated TAFIII10. The protein is a component of the TFIID fraction required for reconstituting RNA

AAT79604 encodes Drosophila TATA-binding protein associated factor (TAF) polypeptide, dTAFII110 (mol. weight 110kD). TAF peptides derived from dTAFII30 alpha, dTAFII30 (mol. weight 110kD). TAF peptides derived dTAFII30, dTAFII30, dTAFII30, and dTAFII250, their human equivalents and nucleic acids encoding them, are used to modulate transcription, initiation. TAFS are nuclear proteins involved in RNA polymerase I, II and III transcription. The peptides act by binding to a different TAF, an activator, or TBP (TATA-binding protein) or competitively inhibiting association of a TAF domain with another compound, typically a protein like TBP or another TAF, an activator, or DNA.

 The invention describes a method of screening a candidate antifungal compound for interaction with essential proteins (EP) or for modulation of EP activity e.g fungal gene transcription. The proteins tessted in the invention include RPC34, POP3, TFA2, NAB2, MPT1, MPT2, BOS1, POL30, RSA2, SQT1, MTW1, TFB1, SPC98, BFR2, RNA1, GCD7, SXI6, NIP1, LCP5, NCE103, ECC1, ONC2, CMS1, YPD1, TIM10 and SRB4 from S. cerevisiae, C. albicans and human homologues. The method involves contacting a culture with one or weast compounds and determining the effects on the growth or viability of the culture of Ceals which preferably comprises fungal cells or yeast cells. Preferably the identified compounds interact with, or modulate (preferably inhbit) activity of C. albicans EP. The inhibitor compounds identified by the method are useful for preventing or inhibiting fungal, particularly C. albicans growth in culture or in a mammal. The antifungal agents interact with essential fungal elements that can be used to treat fungal infection by preventing the growth and preferentially killing the fungal infection by preventing the growth and preferentially killing the fungal infection by preventing the protein cativity of mammalian homologues. This sequence encodes a target protein includent and the antifungal compounds, described in the method of the

many property of the present libraries of the library comprises several oligonuclectides, each capable of hybridising selectively to a set of messenger RNAs transcribted from a given transcription unit of the genome. Which encodes one or more messenger RNA splice variants. The oligonuclectide libraries are useful for detecting mRNAs from a blological sample, in expression profiling studies, in qualitatively or quantitatively characterising the corresponding transcriptome, and in detecting RNA transcripts and splice variants of human or animal transcriptomes. The libraries may also be used as specialised minical libraries to detect transcripts of a sub-transcriptome under a particular blological or pathology specific genes such as those genes only expressed in specific tissue under a specific pathological condition; to detect developmental specific genes; and to detect RNA transcripts and splice variants of a patient suffering from a particular disorder. ABN27253 to ABN259589 represent
 New oligonucleotide libraries comprising oligonucleotides which selectively hybridize to mRNAs transcribed from a transcription unit of a genome, useful for detecting tissue-, pathology-, and developmental-specific genes
 the exemplification of the present invention.

N.B. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO

Proc. Natl. Acad. Sci. U.S.A. 90:1536-1540(1993).

-I- FUNCTION: MIGHT FUNCTION AS A CALCIUM-SEQUESTERING "SPONGE" TO
REGULATE THE AMOUNT OF FREE CYTOPLASMIC CALCIUM. IT BINDS 0.3 MOL
OF CA+2 PER MOL OF PROTEIN.
-I- SUBUNIT: HOMODIMER (PROBABLE).

Pred. No. is the number of results predicted by chance to have a

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

 Mapping information for this clone was provided by Dr. John D. McPherson, Department of Genetics, Washington University, St. Louis MO. For additional information about the map position of this sequence, see http://genome.wustl.edu/gsc
 The clone sequenced to the left is RP11-67F3; the clone sequenced to the right is RP11-224E18. Actual start of this clone is at base position 1 of RP11-119H12; actual end is at base position 182805 of
 Direct Submission
Submitted (08-AUG-2002) Genome Sequencing Center, Washington
University School of Medicine, 4444 Forest Park Parkway, St. Louis,
MD 63108, USA
6 (bases 1 to 182805)
 Direct Submission
Submitted (10-AUG-2002) Department of Genetics, Washington
University, 4444 Forest Park Avenue, St. Louis, Missouri 63108, USA
On Aug 8, 2002 this sequence version replaced gi:21240754.
 Submitted (29-MAY-2002) Genome Sequencing Center, Washington University School of Medicine, 4444 Forest Park Parkway, St. Louis, MO 63108, USA
University School of Medicine, 4444 Forest Park Parkway, St. Louis, MO 63108, USA
 This sequence was finished as follows unless otherwise noted: all regions were double stranded, sequenced with an alternate chemistry, or covered by high quality data (i.e., phred quality >= 30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by sequence from more than one subclone; and the assembly was confirmed by restriction digest.
 NOTICE: This sequence may not represent the entire insert of this
 donor, as described by Osoegawa, K., Woon, P.Y., Zhao, B., Frengen, B. Atteno, M., Catanese, J. J. and de Jong, P.J. (1998) An improved approach for construction of bacterial artificial chromosome libraries. Genomics 51:1-8. The clone may be obtained either from and coworkers at http://www.resgen.com) or Pleter de Jong VECTOR: pBACe3.6
 clone. It may be shorter because we only sequence overlapping clone sections once, or longer because we provide a small overlap between neighboring data submissions.
 SOURCE INFORMATION:
The RPCI-11 human BAC library was made from the blood of one male

HSU/5308 4233 bp mRNA linear PRI 14-DEC-1996
Human TBP-associated factor (hTAFII130) mRNA, partial cds.
U75308
 Submitted (17-0CT-1996) Microbiology, NVU Medical Center, 550 First Ave., New York, NY 10016, USA
See GenBank Accession Number 105309 for hTAFII100; the 5' end is missing from the cDNA as this region is rich in GC residues; a few ambiguities remain in the CDNA sequence that may affect the reading frame near the 5' end; repeated efforts to obtain the full cDNA have been unsuccessful; numerous sequence runs have been performed to clarify the GC sequence ambiguities; the process is still
 /1...2844
/gene="hpAriii30"
/note="the C-terminal region is similar to Drosophila

 NOTE: This is a 'working draft' sequence. It currently consists of 12 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

Pred. No. is the number of results predicted by chance to have a

em\_htgo\_hum:\* em\_htgo\_mus:\* em\_htgo\_other:\*

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
